CONCRETE  
WATERPROOFING

## BACKGROUND

At the Thalaso Terapija construction site, the construction team noted that mounting, flushing water did not cause the problem with flooding inside the building.

The team selected Kryton International's Krystol waterproofing system. The Krystol products were used to prevent water coming inside the concrete structure. The success was above everyone's expectations.

## SOLUTION

Standard procedure for the KIM application was followed to ensure the concrete retention wall and structure was placed on the open stone, as shown in the pictures.

Based on Kryton's proprietary crystalline waterproofing technology, the Krystol® System employs advanced integral crystalline waterproofing technology to transform porous concrete into a permanent, water-resistant barrier and provides a guaranteed defense against water damage and steel reinforcement corrosion through constant head pressure. When combined with water and concrete, Krystol® causes millions of needle-like crystals to grow and spread concrete particles and permanently block the movement of water and waterborne contaminants and resisting hydrostatic pressure. If cracks later form, incoming water cause additional crystals to grow, filling the cracks and ensuring that the structure's waterproofing barrier is protected.
